PaytmAI VyaparVoice

Voice-delivered customer win-back copilot for neighbourhood shops

* **Team SemiTechnical:** Kevin Joseph | Track 1: Merchant Growth AI
* **Live Demo:** https://paytmai-vyaparvoice.onrender.com/
* **GitHub:** https://github.com/somebeing2/paytmai-vyaparvoice

Regular Customers Slip Away Quietly

Synthetic 60-day ledger: 175 repeat regulars of 240 buyers

48 Silent Regulars

Unseen 16-38 days; 40 eligible after permission and cooldown.

Monthly Spend at Risk

Rs 4,920 (2 x Rs 205 x 12), possibly after a busy rush.

70% Dead-Hour Drop

3-5 PM scans drop to 30 and 34 vs 101 at 2 PM.

Win-Back Copilot: Detect, Propose, Cap, Measure

1. Detect

Spot silent regulars

2. Propose

Rs 25 off Rs 150+

3. Cap

Hard Rs 300 stop

4. Measure

80/20 holdout check

BUILT

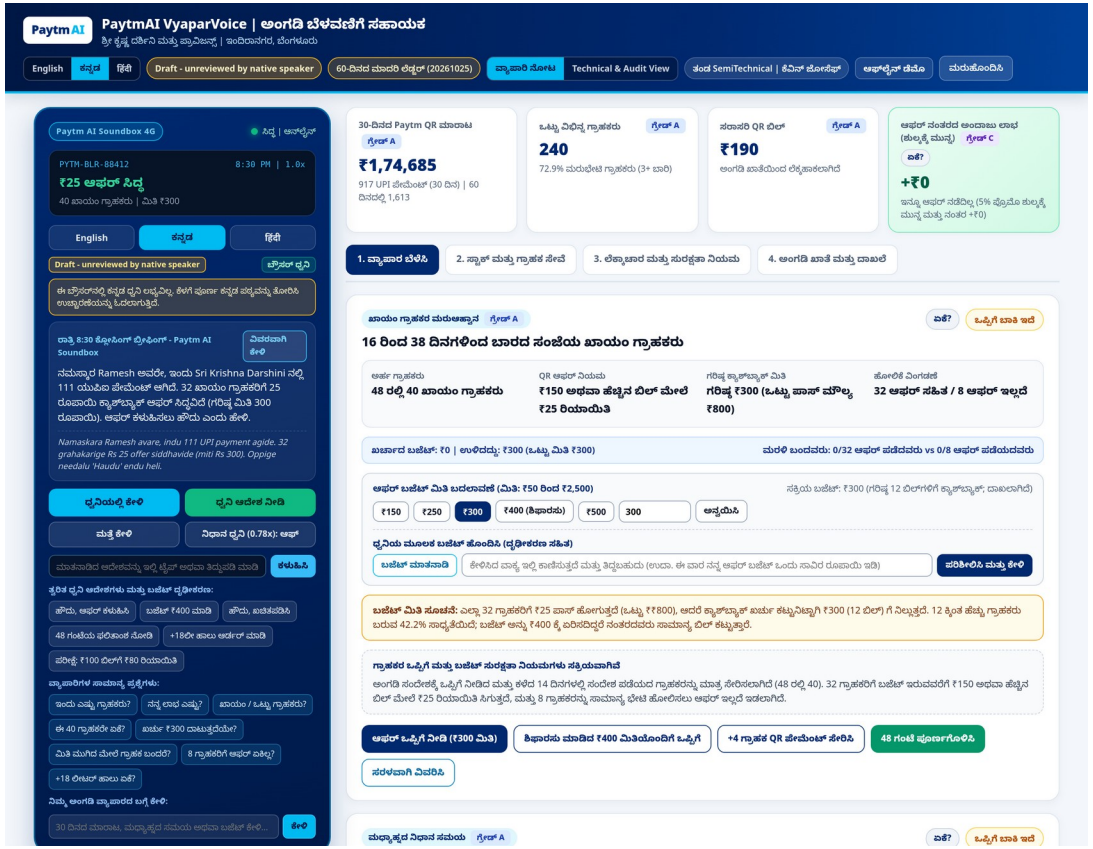

* **Voice out:** Briefings, cap alerts, plain readout (KN/HI/EN).
* **Screens:** Merchant, Why?, and Technical views.

PROPOSED

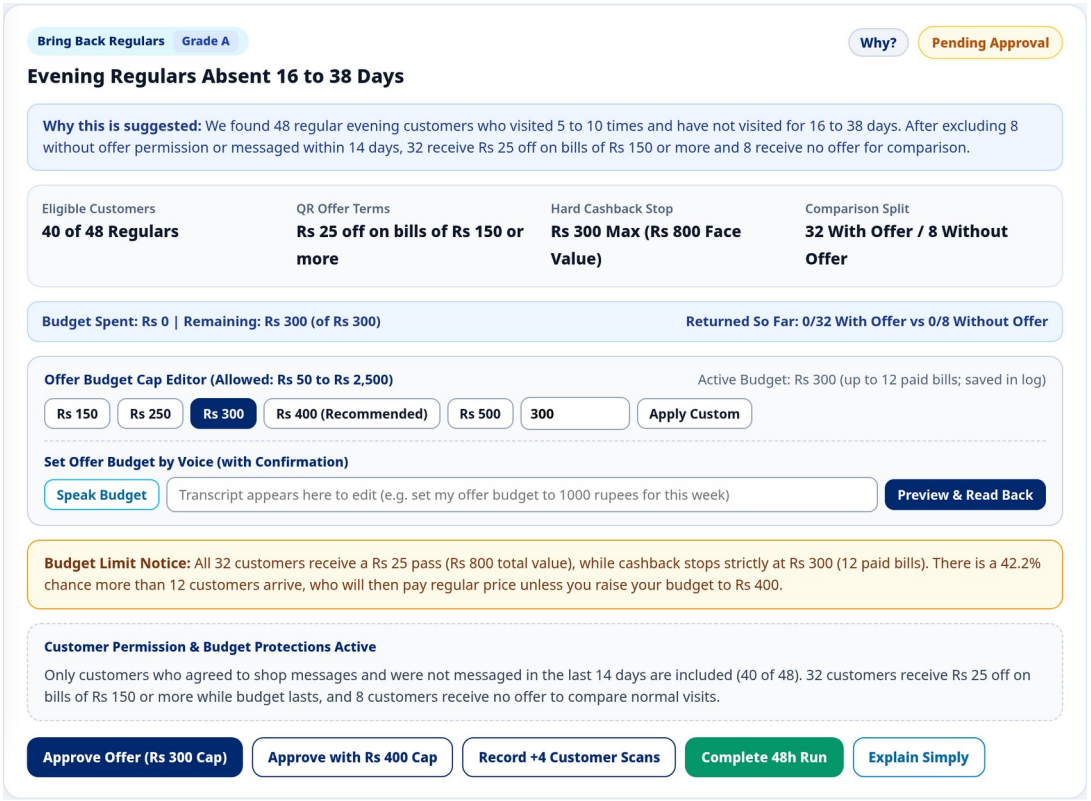

* **Soundbox:** Speaker-based, no mic (validate with Paytm).
* **Paytm app:** Voice replies (browser mic in demo).

Product in Action (Local App, Zero Keys)

Kannada Merchant View & Win-Back Card

Expanded Why? Provenance Panel

Holdout Design and Simulated 48h Outcome

Illustrative simulation on synthetic data, not evidence of lift

* **Design:** Rs 300 cap; 80/20 holdout (32 vs 8).
* **Grade A:** Observed ledger counts.
* **Grade B:** Offer vs holdout returns.
* **Grade C:** Assumed margin and fee profit.

* **Returns:** 12/32 (37.5%) vs 1/8 (12.5%).
* **Extra visits:** 8 visits (Rs 1,740 sales).
* **Pre-fee:** +Rs 222 (assumed 30% margin).
* **Post-5%-fee:** +Rs 91.50 (assumed fee).

Why Every Number Can Be Trusted

1. Code Math

Python computes figures; zero PII leaves.

2. Fallback

Sarvam -> Groq -> Browser speech & templates.

3. Digit Gate

Verifies EN, HI, KN digits on AI replies.

4. Safeguards

Audit log, cache, call caps, PIN gate.

Repo verification: 12 preflight gates, 7 test suites (311 asserts), 21 QA checks.

Business Case and Store Margin Limits

For Merchants

Capped, measured win-back in Kannada, Hindi, or English.

For Paytm (Assumption)

More use of Soundbox and QR with measurable offers.

Who Pays & Modelled Cost

Open assumption (5% fee assumed); Rs 48/mo cached cost (modelled assumption).

Margin Limitation

Positive near 30% margin (darshinis first); kiranas need smaller presets.

Proposed Pilot Plan and Honest Limits

PROPOSED OPT-IN PILOT

* **Design:** Multi-shop darshini pilot with randomized 80/20 holdout.

* **Stop rules:** Halt on negative post-fee return, cap overrun, or opt-outs.

HONEST LIMITATIONS

* **Data:** Synthetic 60-day ledger and simulated returns.

* **Language:** Draft Hindi and Kannada pending native review.

* **Hardware:** Speaker-based Soundbox, no mic (validate with Paytm).

* **Sample:** Single-wave results are directional only.

AI Tools, Safeguards, and Team

* **Build tools:** Claude for planning/review; AI coding agent for code.

* **Runtime AI:** Sarvam primary, Groq backup, browser speech fallback.

* **Human role:** Problem, caps, holdout rules, disclosures, 12-gate checks.
